FLOOD LENS / SITUATION REPORT

Trishuli river corridor

Event date: 2026-08-26 | Mode: DEMO

SYNTHETIC DEMO: not observations or results for the actual event.

Flood extent

Mapped potential new inundation covers 42.080 km2. Possible debris or land-cover change covers 9.080 km2. These are estimates derived from the change polygons.

Infrastructure exposure

The mapped changes intersect 79 buildings, 7 road features and 3 bridges. Intersecting road length is 6.000 km. Exposure does not establish structural damage.

Road access

Assuming exposed road segments are impassable, 3 settlements lose their previous connection to every mapped town or hospital: Demo east village, Demo upper village, Demo riverside village. 0 settlements could not be assessed. Routes outside the analysis area are unknown.

Data provenance

Radar acquisitions: 2026-08-20T00:00:00Z and 2026-09-01T00:00:00Z; both use relative orbit 19 (ascending). Historical OpenStreetMap snapshot: 2026-07-27. All counts come from saved map intersections and road-graph analysis.

Limitations

This educational prototype cannot give minute-ahead warnings. Radar shadow, layover, vegetation, cloud, seasonal changes and incomplete OSM roads can affect results. Exposure and road interruption are hypotheses requiring field verification. Population and casualty estimates are unavailable.
